

TRANZAK PAYMENT API INTEGRATION SETUP GUIDE

The developer portal is the place you manage everything you need to use our API. Here are the few steps you required in order to get started with the payment API.

Step 1: Sign up on Tranzak business portal

Use this link to access our business portal and create an account: <https://biz.tranzak.me>

Step 2: Generate API Keys

All API calls to our payment system require a token. And the token generation requires an API key which can be generated from Tranzak developer portal. You can access the developer portal from the business portal, by clicking on “Developer portal” from the left navigation menu. You need two API keys: Sandbox and Production API keys (as shown below in figure 1)

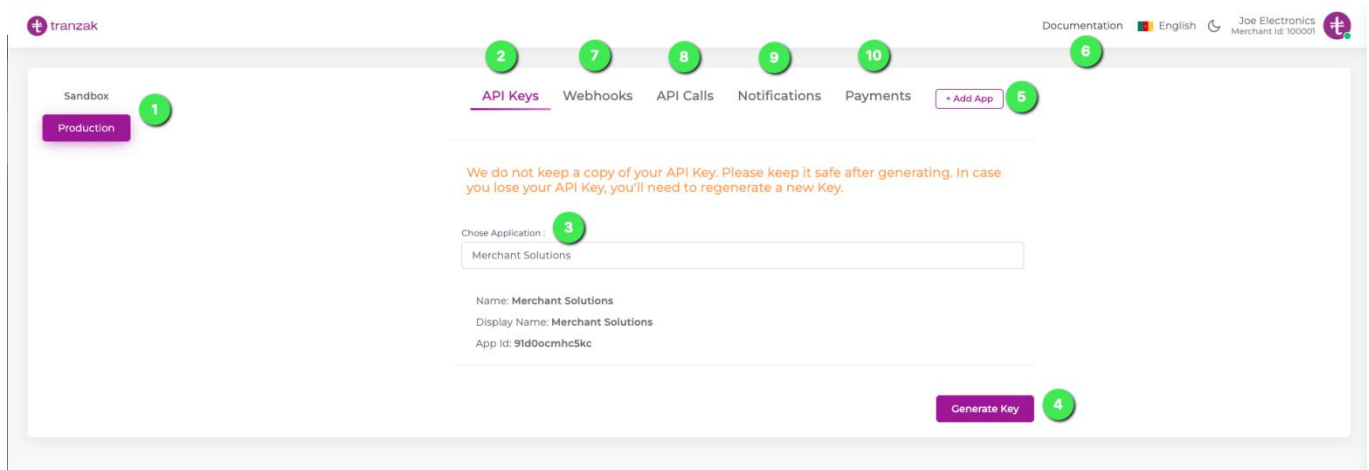

Step 3: Consume the API

Here is the official API documentation: <https://docs.developer.tranzak.me>

You can choose the APIs you would like to use. If you just want to receive payments, check the “Payment Request” section of the docs.

DEVELOPER PORTAL KEY FEATURES

The Tranzak developer portal interface below(see fig 1), shows the main features available for developers using Tranzak payment API.

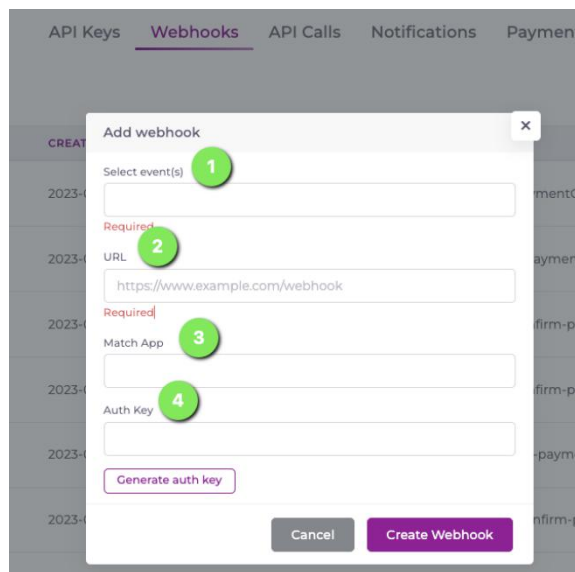

(Fig 1)Tranzak developer portal

1. Switch between production and sandbox environments.

2. Manage your API Keys.
3. Choose the App for which you want to manage API Keys.
4. Generate API Key for the selected APP and for the selected Environment. Note that we don't keep copies of your API keys, If you loose your key you need to re-generate a new one.
5. Add a new APP. All API keys are tied to an APP. A default App is created for you as you sign up, but you can also create additional APPs for different use cases.
6. Check the documentation for payment API integration.
7. Manage payment web-hooks (API callbacks. More details further below).
8. View recent API calls made to Tranzak(Can be used for troubleshooting)
9. View notifications and webhook calls from Tranzak to your system.
10. View payments made through your system.

MANAGE WEBHOOKS

Webhooks are a way to get notified when the transaction state changes(when an event happens). eg. Payment Complete, Payment Failed, etc. You can listen to all events or a particular event.

(Fig 2) Add webhook interface

- 1) Choose the event you want to list to. To listen to all events, choose “*”
- 2) The callback URL that will be called to notify your system
- 3) The App you want to target.
- 4) Optional: A security key to make sure only Tranzak is calling your URL. If a key is given, we pass the key in every call made to your system, and you should verify and only accept the payload if the key matches.
